## INDAZOLE DERIVATIVES AS CRF ANTAGONISTS

### CROSS REFERENCE TO PRIOR APPLICATIONS

- 5 This application claims benefit under Title 35 U.S.C. 119(e) of U.S. Provisional Application No. 60/430,168, filed December 2, 2002, which is hereby incorporated by reference in its entirety.

### FIELD OF THE INVENTION

This invention relates indazole derivatives of formula I and II with CRF activity, and associated 10 pharmaceutical compositions, and methods for use as therapeutic agents.

### BACKGROUND OF THE INVENTION

Corticotropin releasing factor (CRF) or hormone (CRH) is one of several neurohormones 15 synthesized by specific hypothalamic nuclei in the brain where it activates the transcription of the pro-opiomelanocortin (POMC) gene resulting in release of adrenocorticotropic hormone (ACTH) and beta-endorphin from anterior pituitary cells (Vale *et al*, *Science* 213, 1394-1397 (1981)). The fundamental role of CRF is to prepare the organism for an appropriate response to various stressors such as physical trauma, insults of the immune system and social interactions. CRF also 20 has CNS effects by acting at higher centers in the brain, particularly cortical regions where there is a widespread distribution of CRF neurons. CRF is believed to be a key intermediary in communication between the immune, central nervous, endocrine and cardiovascular systems (Sapolsky *et al*, *Science* 238, 522-524 (1987)). The role played by CRF in integrating the response of the immune system to physiological, psychological and immunological stressors has 25 been described in the art, e.g. J.E. Blalock, *Physiological Reviews* 69, 1 (1989) and J.E. Morley, *Life Sci.* 41, 527 (1987).

CRF antagonists are effective in the treatment of a wide range of stress-related illnesses, mood 30 disorders such as depression, major depressive disorder, single episode depression, recurrent depression, child abuse induced depression, postpartum depression, dysthemia, bipolar disorder and cyclothymia; chronic fatigue syndrome; eating disorders such as obesity, anorexia and

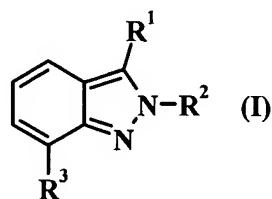

bulimia nervosa; generalized anxiety disorder; panic disorder; phobias; obsessive-compulsive disorder; post-traumatic stress disorder; pain perception such as fibromyalgia; headache; stress-induced gastrointestinal dysfunction such as irritable bowel syndrome (IBS), colonic hypersensitivity or spastic colon; hemorrhagic stress; ulcers; stress-induced psychotic episodes; 5 inflammatory disorders such as rheumatoid arthritis and osteoarthritis; asthma; psoriasis; allergies; premature birth; hypertension; congestive heart failure; sleep disorders; neurodegenerative diseases such as Alzheimer's disease, senile dementia, Parkinson's disease and Huntington's disease; head or spinal cord trauma; ischemic neuronal damage; excitotoxic neuronal damage; epilepsy; stroke; psychosocial dwarfism; chemical dependencies and 10 addictions; drug and alcohol withdrawal symptoms; stress-induced immune dysfunctions; immune suppression and stress-induced infections; cardiovascular or heart related diseases; fertility problems; and /or human immunodeficiency virus infections. Accordingly clinical data suggests that CRF receptor antagonists may represent novel antidepressants and/or anxiolytic drugs that may be useful in the treatment of the neuropsychiatric disorders manifesting 15 hypersecretion of CRF.

In view of the above, efficacious and specific antagonists of CRF are desired as potentially valuable therapeutic agents for the treatment of psychiatric disorders and neurological diseases. It is thus desirable to discover new CRF antagonists.

Published PCT application WO 02/16348 (L. Hennequin) describes indazole derivatives 20 which are inhibitors of vascular endothelial growth factor. Published PCT application WO 01/58869 A2 (K. Leftheris *et al.*) discloses indazole derivatives which are cannabinoid receptor modulators.

The term “optional” or “optionally” as used herein means that a subsequently described event or circumstance may, but need not, occur, and that the description includes instances where the event or circumstance occurs and instances in which it does not. For example, “optional bond” means that the bond may or may not be present, and that the description includes single, double, or triple bonds.

“Isomerism” means compounds that have identical molecular formulae but that differ in the nature or the sequence of bonding of their atoms or in the arrangement of their atoms in space. Isomers that differ in the arrangement of their atoms in space are termed “stereoisomers”. Stereoisomers that are not mirror images of one another are termed “diastereoisomers”, and stereoisomers that are non-superimposable mirror images are termed “enantiomers”, or sometimes optical isomers. A carbon atom bonded to four nonidentical substituents is termed a “chiral center”.

“Chiral isomer” means a compound with one chiral center. It has two enantiomeric forms of opposite chirality and may exist either as an individual enantiomer or as a mixture of enantiomers. A mixture containing equal amounts of individual enantiomeric forms of opposite chirality is termed a “racemic mixture”. A compound that has more than one chiral center has  $2^{n-1}$  enantiomeric pairs, where n is the number of chiral centers. Compounds with more than one chiral center may exist as either an individual diastereomer or as a mixture of diastereomers, termed a “diastereomeric mixture.” When one chiral center is present, a stereoisomer may be characterized by the absolute configuration (R or S) of that chiral center. Absolute configuration refers to the arrangement in space of the substituents attached to the chiral center. The substituents attached to the chiral center under consideration are ranked in accordance with the *Sequence Rule* of Cahn, Ingold and Prelog. (Cahn et al. *Angew. Chem. Inter. Edit.* 1966, 5, 385; errata 511; Cahn et al. *Angew. Chem.* 1966, 78, 413; Cahn and Ingold *J. Chem. Soc. (London)* 1951, 612; Cahn et al. *Experientia* 1956, 12, 81; Cahn, *J. Chem. Educ.* 1964, 41, 116).

"Geometric Isomers" means the diastereomers that owe their existence to hindered rotation about double bonds. These configurations are differentiated in their names by the prefixes *cis* and *trans*, or *Z* and *E*, which indicate that the groups are on the same or opposite side of the double bond in the molecule according to the Cahn-Ingold-Prelog rules.

"Atropic isomers" means the isomers owing their existence to restricted rotation caused by hindrance of rotation of large groups about a central bond.

10 The phrase "substantially pure" as used herein means at least about 90 mole percent of the desired compound, enantiomer or stereoisomer is present compared to other possible configurations.

15 The phrase "pharmaceutically acceptable" as used herein means that which is useful in preparing a pharmaceutical composition that is generally safe, non-toxic, and neither biologically nor otherwise undesirable and includes that which is acceptable for veterinary as well as human pharmaceutical use.

20 The phrase "pharmaceutically acceptable salts" of a compound as used herein means salts that are pharmaceutically acceptable, as defined herein, and that possess the desired pharmacological activity of the parent compound. Such salts include:

(i) acid addition salts formed with inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, and the like; or formed with organic acids such as acetic acid, benzenesulfonic acid, benzoic acid, camphorsulfonic acid, citric acid, ethanesulfonic acid, fumaric acid, glucoheptonic acid, gluconic acid, glutamic acid, glycolic acid, hydroxynaphthoic acid, 2-hydroxyethanesulfonic acid, lactic acid, maleic acid, malic acid, malonic acid, mandelic acid, methanesulfonic acid, muconic acid, 2-naphthalenesulfonic acid, propionic acid, salicylic acid, succinic acid, tartaric acid, p-toluenesulfonic acid, trimethylacetic acid, and the like; or

5 all references to pharmaceutically acceptable salts include solvent addition forms (solvates) or crystal forms (polymorphs) as defined herein, of the same acid addition salt.

The term "crystal forms" or "polymorphs" means crystal structures in which a compound can crystallize in different crystal packing arrangements, all of which have the same elemental  
10 composition. Different crystal forms usually have different X-ray diffraction patterns, infrared spectra, melting points, density, hardness, crystal shape, optical and electrical properties, stability and solubility. Recrystallization solvent, rate of crystallization, storage temperature, and other factors may cause one crystal form to dominate.

15 The term "solvates" as used herein means solvent additions forms that contain either stoichiometric or non-stoichiometric amounts of solvent. Some compounds have a tendency to trap a fixed molar ratio of solvent molecules in the crystalline solid state, thus forming a solvate. If the solvent is water the solvate formed is a hydrate, when the solvent is alcohol, the solvate formed is an alcoholate. Hydrates are formed by the combination of one or more molecules of  
20 water with one of the substances in which the water retains its molecular state as H<sub>2</sub>O, such combination being able to form one or more hydrate.

"Subject" means mammals and non-mammals. Mammals means any member of the *Mammalia* class including, but not limited to, humans; non-human primates such as chimpanzees and other  
25 apes and monkey species; farm animals such as cattle, horses, sheep, goats, and swine; domestic animals such as rabbits, dogs, and cats; laboratory animals including rodents, such as rats, mice, and guinea pigs; and the like. Examples of non-mammals include, but are not limited to, birds, and the like. The term "subject" does not denote a particular age or sex.

30 "Therapeutically effective amount" means an amount of a compound that, when administered to a subject for treating a disease state, is sufficient to effect such treatment for the disease state. The "therapeutically effective amount" will vary depending on the compound, disease state being treated, the severity or the disease treated, the age and relative health of the subject, the route and

form of administration, the judgment of the attending medical or veterinary practitioner, and other factors.

“Disease state” means any disease, condition, symptom, or indication. “Treating” or “treatment” 5 of a disease state includes: (i) preventing the disease state, i.e. causing the clinical symptoms of the disease state not to develop in a subject that may be exposed to or predisposed to the disease state, but does not yet experience or display symptoms of the disease state; (ii) inhibiting the disease state, *i.e.*, arresting the development of the disease state or its clinical symptoms, or (iii) relieving the disease state, *i.e.*, causing temporary or permanent regression of the disease state or 10 its clinical symptoms.

“Mood disorders” or “affective disorders” mean psychopathologic conditions in which a pervasive disturbance of mood constitutes the core manifestation. These terms subsume anxiety and related neuroses, especially the depressive form. Examples of “mood disorders” or “affective 15 disorders” include, but are not limited to, depression, major depressive disorder, single episode depression, recurrent depression, child abuse induced depression, postpartum depression, dysthemia, unipolar disorder, bipolar disorder with manifestations of insomnia and eating disorder, dysthymic disorder, double depression, morbid and clinical depression, mania and cyclothymia.

#### Compound Preparation

The compounds of Formulae I and II described herein may be prepared by standard synthetic methods. In particular, certain compounds of Formulae I and II may be prepared utilizing as an intermediate 7-bromoindazole (3), the preparation of which is illustrated in Scheme 1. Deprotonation of 3 and N-alkylation of the tautomeric anion with dimethyl sulfate produces a separable mixture of 2-methyl-7-bromoindazole (4) and 1-methyl-7-bromoindazole (18). The R<sup>3</sup> (optionally substituted aryl or heteroaryl) substituent can be introduced by standard aryl coupling procedures which are well known in the art. The resulting 7-aryl (or heteroaryl) indazoles, e.g., 4, are readily transformed into the compounds of the present invention as outlined in Schemes 1-3. Similar transformations can be used to convert 18 into the compounds of formula II.

Nitration of **4a** produces a mixture of regioisomeric nitroindazoles from which the 3-nitroindazole **7a** is readily isolated. The nitro substituent can be reduced to the corresponding amine **8a** under standard conditions. An alternate route to **8a** involves treatment of **4a** with n-butyllithium to produce the 3-lithiated heterocycle **11** which is quenched with carbon dioxide to

produce carboxylic acid **10a**. The amine can be prepared from carboxylic acid **10a** utilizing the Curtius rearrangement or a variant thereof (*J. March Advanced Organic Chemistry* 4<sup>th</sup> Ed J Wiley & Sons: New York, 1991; pp 1090-1095). The carboxylic acid or the corresponding carbocyclic ester can be converted into amides of the present invention by condensation protocols well known in the art (see, e.g. Example 8 and 10).

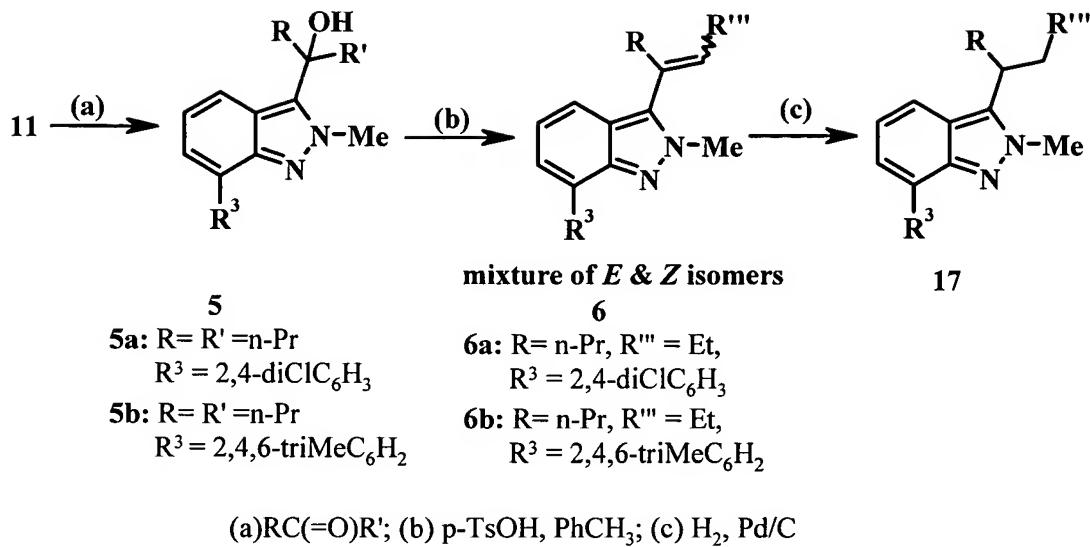

SCHEME 2

Conversion of amine **8a** into amide **12a** can be achieved by a variety of methodologies well known in the art (*J. March Advanced Organic Chemistry* 4<sup>th</sup> Ed J Wiley & Sons: New York, 1991; pp 417-424). Reduction of the amide with borane-THF complex, or other reducing agents, (*J. March supra*, pp 445-446) affords the secondary amine **13a** that can be further transformed to the tertiary amine **15a** by reductive amination or *via* a second acylation and reduction sequence. Alternatively tertiary amines **14a** can be prepared directly from **8a** by reductive amination. (Scheme 2) The stepwise procedure permits the preparation of tertiary amines with different substituents on the nitrogen atom.

The lithiated heterocycle **11** (Scheme 3) can be quenched with carbonyl compounds to produce carbinols **5** which, in turn, can be dehydrated to olefins **6** described herein. The dehydration produces a mixture of geometrical isomers. The present invention includes both the pure *E* and *Z* isomers and mixtures thereof. The olefins optionally can be further converted to the corresponding alkane **17**.

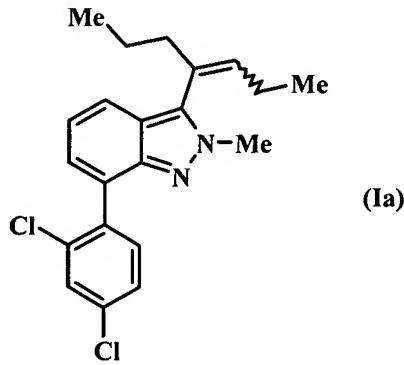

SCHEME 3

- 5 Some compounds in Schemes 1-3 are depicted with specific R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> substituents; however, one skilled in the art will immediately realize that these reactions are also applicable to other compounds contemplated in this invention. Furthermore, the sequence of the synthetic steps can be altered if necessary. Examples 9-11 exemplify incorporation of the aryl group at position by palladium-catalyzed coupling after elaboration of the functionality at the 3-position. The reaction

#### Intracellular cAMP Stimulation Assay

Human Y-79 retinoblastoma cells are grown in RPMI 1640 medium with 15% FBS. Measures of cAMP accumulation are performed by using NEN Adenylyl Cyclase FlashPlate kit (SMP004). The cells are separated from culture medium, washed twice with PBS (150 Xg, 8 min), resuspended (2E+6 cells/ml) in Stimulation Buffer (provided in the kit), and then added to 96-well FlashPlates, (50,000 cells per well). Various concentrations of test compounds are incubated with the cells for 20 min prior to the addition of hCRF (30 nM). The total assay volume is 100 µl. The assay is terminated after 20 min after addition of the hCRF by addition of Detection Buffer and [<sup>125</sup>I]cAMP. After 2 hr at room temperature the mixtures are aspirated and the bound radioactivity is measured with a Packard TopCount. The potency (IC<sub>50</sub> values) of test compounds in inhibiting the hCRF-stimulated accumulation of cAMP is determined by nonlinear regression analyses with interactive curve-fitting procedures.

#### CRF Receptor Binding Assay

Human IMR-32 neuroblastoma cells are grown to 80% confluence in MEM medium containing 10% heat-inactivated FBS, 1mM Sodium Pyruvate, and 0.1mM nonessential amino acids. Cell membranes are prepared according the method of Dieterich and DeSouza (1996). The cells (~5E+9) are resuspended in 10 volumes of wash buffer (5 mM Tris HCl, 10 mM MgCl<sub>2</sub>, 2

5 mM EGTA, pH 7.4 at RT), homogenized with a Polytron, and then centrifuged at 45,000 G for 20 min at 4°C. The membrane pellets are washed twice with wash buffer (45,000 G for 20 min at 4°C) and then resuspended (50 mM Tris HCl, 10 mM MgCl<sub>2</sub>, 2 mM EGTA, pH 7.4 at RT). Protein concentration is determined using Pierce reagents and BSA as standard. Aliquots of 1-1.5 mL are stored at -80°C until binding assay.

The competition binding assay is performed in a final volume of 250 µl, which contains assay buffer (50 mM Tris-HCl, 10 mM MgCl<sub>2</sub>, 2 mM EGTA, 0.2% BSA, 0.1mM bacitracin and 100 kIU/mL aprotinin pH 7.2 at rt), 0.05 nM [<sup>125</sup>I]Tyr<sup>0</sup>-ovine CRF (Du Pont New England Nuclear), 50 µg of membrane protein, and test compound at various concentrations. Non-specific 10 binding is determined with 1 uM hCRF. Binding reactions are terminated after 2 hr incubation at 25°C by filtering through 96-w GF/C filter plate using a Packard Harvester (Filtermate 196). The 96-w filter plate is pre-treated with 0.3% polyethyleneimine and pre-washed with washing buffer (50 mM Tris-HCl, 10 mM MgCl<sub>2</sub>, 2 mM EGTA, 0.2% BSA, pH 7.2 at 4°C). Unbound 15 radioactivity is removed by four rapid washes (0.8 ml/well) with wash buffer. The radioactivity is quantified using a Packard TopCount. Data are analyzed using non-linear iterative curve fitting to obtain IC<sub>50</sub> and Hill slope values. PKi values are derived from pIC<sub>50</sub> values (-log of IC<sub>50</sub>).

20 The compounds of the present invention were active in receptor binding and functional assays. The pIC<sub>50</sub> of representative examples in the CRF1 functional assay are shown in Table 2,
